

# Integrated Microwave & Cellular Network Management

IMIssoft are pleased to introduce **TelcoBASE**, a power packed tool that presents the Management with an integrated total perspective of activities related to Cellular Network Management.

**TelcoBASE** provides a common resource for inputting, sharing and managing critical information, documents for multiple sites at multiple locations.

# TelcoBASE

TelcoBASE is a unique management tool that simplifies management of communication networks and telecom activities at multiple locations.

Using an intuitive interface that hosts geographical locations of the microwave towers, TelcoBASE:

- Makes access quicker and faster to relevant information concerning microwave and cellular networks.
- Improves asset management, maintenance management, warehouse management and other operations related functions
- Offers high levels of security and personalized access to users
- Streamlines knowledge sharing across the organisation
- Drastically reduces costs of distributing information to executives and staff
- Presents network related information in a coherent, timely manner through the use of its own communications channel

TelcoBASE

# Integrated Microwave and Cellular Network management

**TelcoBASE integrates microwave and cellular network management, removing traditional constraints on accessing and delivering information.**

**As with all IMIsoft applications, it has been designed to be flexible, scalable and more importantly secure.**

With its GIS features, TelcoBASE presents the Top Management with an overall view of all the microwave towers in place. The network can be created right from the desktop using real geographical coordinates aided with sophisticated tools and interfaces. The Cell coverage can be plotted as a layer to scale.

TelcoBASE offers a compelling alternative to traditional methods of network management that often consume hours of people time. Added to this, TelcoBASE collects and communicates virtually all types of media - a true one-stop shop for information!

TelcoBASE is an interactive tool. It will provide alarms and triggers based on events such as the next date of maintenance for a particular equipment. Compatible with existing database technologies, TelcoBASE can manage information based on text, photos, graphics, formulae, audio and video. Data input under user control is flexible and may be manual, scanned information, via file transfers and/or using live data links. Output can be generated through PC's, printers and e-mail.
